Association CNVC00114

Picea mariana / Salix myrtillifolia / Hylocomium splendens – Aulacomnium palustre
Black Spruce / Low Blueberry Willow / Ribbed Bog Moss – Stairstep Moss
Épinette noire / Saule à feuilles de myrtille / Aulacomnie des marais – Hylocomie brillante

Subassociations: 114a typic, 114b *Rhododendron groenlandicum*

CNVC Alliance: CA00050 *Picea mariana (Larix laricina) / Vaccinium vitis-idaea – Equisetum spp.*

CNVC Group: CG0022 West-Central Boreal Black Spruce – Tamarack Poor – Intermediate Treed Wetland

Source: Yukon government

Type Description

Concept: CNVC00114 is a boreal wetland coniferous woodland or forest Association that ranges from Yukon to Alberta. It has a sparse to moderately closed tree layer of stunted (usually < 10m height), narrow-crowned black spruce (*Picea mariana*), typically with a minor component of white spruce (*P. glauca*), although the two species can occur in varying proportions. The shrub layer is dense and characterized by abundant common Labrador tea (*Rhododendron groenlandicum*) and low blueberry willow (*Salix myrtillifolia*), often with patches of black spruce and either glandular birch (*Betula glandulosa*) or arctic dwarf birch (*B. nana*). Bog bilberry (*Vaccinium uliginosum*) is less common but can be abundant when present. The herb and dwarf shrub layer is poorly to well developed; lingonberry (*Vaccinium vitis-idaea*) and red bearberry (*Arctous rubra*) are common, and usually occur with low cover of horsetails (*Equisetum scirpoides*, *E. arvense*, *E. sylvaticum* and/or *E. fluviatile*). The moss layer is continuous and dominated by stairstep moss (*Hylocomium splendens*) and ribbed bog moss (*Aulacomnium palustre*), with small patches of reindeer lichens (*Cladina mitis*, *C. rangiferina* and/or *C. stellaris*) on drier microsites. CNVC00114 occurs on cold, moist to wet, mainly nutrient-medium sites in a region with a subhumid boreal climate. Substrates are either mineral or organic, and may be underlain by permafrost, particularly in the northwestern part of the range. Although fire can occasionally occur, this is typically a stable condition. Local hydrology is the main driver of vegetation dynamics. There are two subassociations, *typic* and *Rhododendron groenlandicum*.

Vegetation: CNVC00114 is a coniferous woodland or forest Association with a sparse to moderately closed tree layer of typically stunted (< 10m height), narrow-crowned *Picea mariana* and *P. glauca*. *Picea mariana* is usually dominant, but the two species can occur in various proportions. The shrub layer is well developed to dense with abundant *Rhododendron groenlandicum* and less abundant, but constant, *Salix myrtillifolia* and *P. mariana* of various ages. *Betula glandulosa* or *B. nana* and *Vaccinium uliginosum* are less common but can occur in patches. The herb and dwarf shrub layer is poorly to well developed; the only constant species are *Vaccinium vitis-idaea* and *Arctous rubra*. *Equisetum scirpoides*, *E. arvense*, *E. sylvaticum* and/or *E. fluviatile* are frequently present. The moss and lichen layer is generally continuous and dominated by *Hylocomium splendens* and *Aulacomnium palustre*, often with smaller amounts of *Pleurozium schreberi*, *Tomentypnum nitens* and *Sphagnum* spp. *Cladina* spp. (*C. mitis*, *C. rangiferina* and *C. stellaris*) may form patches on drier microsites.

Compared to the *typic*, the *Rhododendron groenlandicum* subassociation has a denser understory dominated by *R. groenlandicum*. It usually has *Empetrum nigrum* present in its less developed herb and dwarf shrub layer.

Canadian National Vegetation Classification (CNVC) Classification nationale de la végétation du Canada (CNVC)

<http://cnvc-cnvc.ca>

Picea mariana / Salix myrtillifolia / Hylocomium splendens – Aulacomnium palustre **CNVC00114**

Type Description (cont'd)

Environment: CNVC00114 occurs in a region with a subhumid continental boreal climate. Stands typically occur around the edges of peatlands in the ecotone between upland and wetland forests on moist to wet, usually nutrient-medium sites. Sites can be level or on gently graded, moisture-receiving, lower or toe slope topopositions. These sites are usually cooler than surrounding areas, either on north aspects or on level sites subjected to cold air ponding. Substrates can be organic soils formed from slowly decomposing mosses, or poorly drained mineral soils of different textures developed in morainal, (glacio)fluvial and (glacio)lacustrine parent materials. Water tables are generally high throughout the year, and sub-surface water movement often contributes nutrient enrichment. Decomposition is slow on these cold sites; as mosses and peat accumulate and insulate the soil, permafrost may develop.

Dynamics: CNVC00114 is generally a stable condition that is maintained by a persistently high water table and moderate nutrient status. Local hydrology is the main driver of vegetation dynamics, although fires occur occasionally on these moist to wet sites. Consequently, stands of CNVC00114 tend to be long lived and multi-aged. Both *Picea mariana* and *P. glauca* can establish from seed under favourable conditions (e.g., suitable seedbed); *P. mariana* also self-replaces on these sites by vegetative layering.

Long-term change in the water table (either by anthropogenic activities or natural causes [e.g., beaver dams]) usually results in changes to the vegetation community. A rise in the water table can result in tree mortality and transition to shrubby wetland vegetation. A drop in the water table can sometimes result in the development of more productive feathermoss forests.

Range: CNVC00114 occurs in the boreal regions of Yukon, British Columbia and Alberta as well as the Rocky Mountain foothills of Alberta. The *typic* subassociation occurs throughout the range, the *Rhododendron groenlandicum* subassociation is described from Yukon.

Conservation Status (NatureServe)

Global Conservation Rank: no applicable rank

National Conservation Rank: not yet determined

Subnational Conservation Rank: not yet determined

Similar CNVC Associations:

CNVC00130 [*Picea mariana* / *Equisetum arvense* (*E. pratense*) / *Hylocomium splendens*] occurs on comparable boreal sites in Alberta but at lower elevations or latitudes. It has a shrub layer with less *Salix myrtillifolia* and *Betula glandulosa* and more *Rosa acicularis* and *Lonicera involucrata*. It lacks *Arctous rubra* in the herb and dwarf shrub layer, but has abundant *Equisetum arvense* and *E. pratense*. It has feathermosses (*Hylocomium splendens*, *Pleurozium schreberi* and *Ptilium crista-castrensis*) dominant in the moss layer.

Related United States National Vegetation Classification Associations:

Relationships with Other Classifications:

Comments

Betula glandulosa here includes both *B. glandulosa* and *B. nana* as the two species were not always reliably identified in the plot data.

CNVC00114 is consistent with the concept of a treed swamp in the Canadian Wetland Classification System.
