Source: Natural Resources Canada - Canadian Forest Service

## Type Description

**Concept:** CNVC00231 is a boreal mixedwood forest Association that ranges from Manitoba to Quebec. It has a closed canopy of balsam fir (*Abies balsamea*) and/or white spruce (*Picea glauca*) with paper birch (*Betula papyrifera*) and/or trembling aspen (*Populus tremuloides*). The shrub layer is well developed and dominated by balsam fir regeneration, although paper birch saplings can be abundant in larger canopy openings. The herb layer is moderately developed and commonly includes bunchberry (*Cornus canadensis*), wild lily-of-the-valley (*Maianthemum canadense*), wild sarsaparilla (*Aralia nudicaulis*), yellow clintonia (*Clintonia borealis*), northern starflower (*Lysimachia borealis*) and twinflower (*Linnaea borealis*). The forest floor cover is mainly broad-leaf litter so the moss layer is sparse, with only minor cover of red-stemmed feathermoss (*Pleurozium schreberi*). CNVC00231 is a mid-seral condition that typically succeeds an early seral, post-fire Association. It occurs in a region with a boreal climate that grades from subhumid continental in the western portion of its range to very humid and more maritime in the east. It is most frequently found on mesic, nutrient-medium sites. As the fire cycle lengthens in the eastern portion of its range, outbreaks of spruce budworm (*Choristoneura fumiferana*) play a greater role in the dynamics of this Association.

**Vegetation:** CNVC00231 is a mixedwood forest Association with a closed canopy that can include various mixes of the conifer species *Abies balsamea* and/or *Picea glauca* with the hardwood species *Betula papyrifera* and/or *Populus tremuloides*. *Picea mariana* is sometimes present. *A. balsamea* regeneration dominates the well-developed shrub layer. *B. papyrifera* saplings can be abundant where canopy openings are large enough to provide adequate light. The herb layer is moderately developed and commonly includes *Cornus canadensis*, *Maianthemum canadense*, *Aralia nudicaulis*, *Clintonia borealis*, *Lysimachia borealis* and *Linnaea borealis*. Forest floor cover is predominantly broad-leaf litter so the moss layer is poorly developed, with only *Pleurozium schreberi* common, mainly on fallen logs and at the base of trees.

**Environment:** CNVC00231 occurs in a boreal climate that is subhumid continental in the western part of its range, becoming very humid and maritime influenced in the east, and more temperate farther south. Regional fire cycles within the range are intermediate (100-270 years), long (270-500 years) or even very long (>500 years). It is commonly found on mesic, nutrient-medium sites. Stands are often on level sites or gentle to moderate slopes on water-shedding, middle to upper-slope topopositions. Soils are usually well drained, moderately deep to deep and coarse-textured, often coarse loams or sands, that develop on morainal, or less frequently, glaciofluvial deposits. Occasionally stands occur on fine-textured sediments deposited by proglacial lakes or seas. Mor humus forms are typical, but compared to other boreal Associations, moder are relatively common.

## **Abies balsamea – Betula papyrifera – Populus tremuloides / Clintonia borealis** **CNVC00231**

### Type Description (cont'd)

**Dynamics:** CNVC00231 is a mid-seral condition that can succeed early seral Associations that establish after fire or harvesting (e.g., CNVC00238 [*Populus tremuloides* (*Betula papyrifera*) / *Diervilla lonicera*]), or can sometimes result from smaller-scale gap or patch disturbances in a late seral Association (e.g., CNVC00222 [*Abies balsamea* / *Pleurozium schreberi*]). *Abies balsamea* is eliminated by fire, but the pioneer species *Betula papyrifera* and *Populus tremuloides* are adapted to disturbance. Following any disturbance that does not kill their roots they can reproduce vegetatively, *B. papyrifera* from stump sprouts and *P. tremuloides* from root suckers. These species also produce abundant, light, wind-dispersed seeds that can readily colonize mineral soil seedbeds exposed by disturbance. Both species grow rapidly in full-light conditions but are intolerant of shade so do not replace themselves in a stand without further disturbance. The shade tolerant conifers *A. balsamea* and/or *Picea glauca* become established in these stands when seeds are disseminated from nearby areas, growing into the canopy and forming CNVC00231 as the pioneer hardwood species decline.

Harvesting and natural disturbances, such as outbreaks of spruce budworm (*Choristoneura fumiferana*) or windthrow events, help to maintain CNVC00231 on the landscape. Canopy openings that result from these disturbances can release the abundant *A. balsamea* regeneration in the understory or, conversely, provide opportunities for the hardwood species (especially *B. papyrifera*) to regenerate by seed or sprouts, maintaining the mixedwood condition. *A. balsamea* is more vulnerable to spruce budworm than is *P. glauca*, so outbreaks of this insect can temporarily encourage dominance of *P. glauca*.

On Anticosti Island, *A. balsamea* and *B. papyrifera* regeneration is heavily grazed by white-tailed deer (*Odocoileus virginianus*) so these forests often become dominated by *P. glauca*, which is not grazed to the same extent. These *P. glauca*-dominated stands are considered to be an alternative state for this Association.

**Range:** CNVC00231 occurs in the boreal region of Quebec and Ontario and likely extends into southeastern Manitoba as far west as Lake Winnipeg. In Quebec, it extends east to the Lower North Shore of the Gulf of Saint Lawrence near the Little Mecatina River and also occurs in the Gaspé region and on Anticosti Island. However, it is most common in the western part of the province and in the Appalachian Mountains and the Gaspé region south of the Saint Lawrence River. CNVC00231 occurs sporadically in the northern temperate region, usually on sites that are cooler than normal for that region (e.g., at higher elevations or on north aspects).

### Conservation Status (NatureServe)

## Related Concepts

Similar CNVC Associations:

CNVC00213 [*Populus tremuloides – Betula papyrifera – Picea mariana – Pinus banksiana / Diervilla lonicera / Pleurozium schreberi*]] occurs on similar sites in the same range but has less *Abies balsamea* and more *Pinus banksiana*.

CNVC00232 [*Abies balsamea – Betula papyrifera / Pleurozium schreberi*] occurs on similar sites in Quebec but has less *Populus tremuloides* and a more developed moss layer with abundant *Pleurozium schreberi* and sometimes *Hylocomium splendens*.

CNVC00234 [*Picea mariana – Betula papyrifera – Abies balsamea / Clintonia borealis*] occurs on similar sites in Quebec and northeastern Ontario but has *Picea mariana* codominant in the canopy.

CNVC00235 [*Abies balsamea – Betula papyrifera / Acer spicatum*] occurs on slightly richer sites in the same range and has abundant *Acer spicatum* and *Corylus cornuta* in the shrub layer.

CNVC00238 [*Populus tremuloides (Betula papyrifera) / Diervilla lonicera*] is a similar hardwood Association that occurs on comparable sites in the same range (see Dynamics).

CNVC00274 [*Betula papyrifera – Abies balsamea / Alnus incana*] occurs on moister, richer sites in Quebec and has less *Populus tremuloides* in the canopy and abundant *Alnus incana* in the shrub layer.
