Association CNVC00241

Populus tremuloides (P. balsamifera) / Alnus incana / Eurybia macrophylla

Trembling Aspen (Balsam Poplar) / Speckled Alder / Large-leaved Aster

Peuplier faux-tremble (Peuplier baumier) / Aulne rugueux / Aster à grandes feuilles

Subassociations: 241a typic, 241b *Populus balsamifera*

CNVC Alliance: CA00017 *Populus tremuloides / Alnus incana / Eurybia macrophylla*

CNVC Group: CG0008 Ontario-Quebec Boreal Moist Black Spruce – Trembling Aspen – Balsam Fir – Paper Birch Forest

Source: Natural Resources Canada - Canadian Forest Service

Type Description

Concept: CNVC00241 is a boreal hardwood forest Association that ranges from Manitoba to Quebec. It has a closed canopy of trembling aspen (*Populus tremuloides*) and/or balsam poplar (*P. balsamifera*) overtopping a dense tall shrub layer that is dominated by speckled alder (*Alnus incana*), with lower abundance of red raspberry (*Rubus idaeus*) and regenerating trembling aspen and balsam fir (*Abies balsamea*). Mountain maple (*Acer spicatum*) is less common but can be locally abundant. The herb layer is usually dense and typically includes dwarf raspberry (*Rubus pubescens*), wild lily-of-the-valley (*Maianthemum canadense*), large-leaved aster (*Eurybia macrophylla*), bunchberry (*Cornus canadensis*), wild sarsaparilla (*Aralia nudicaulis*) and yellow clintonia (*Clintonia borealis*), with lower constancy and cover of several other species. Grasses (*Poaceae*) can be abundant where present. The forest floor cover is mainly broad-leaf litter, so the moss layer is sparse, with only minor cover of red-stemmed feathermoss (*Pleurozium schreberi*). CNVC00241 occurs in a region with a continental boreal climate that grades from subhumid in the western portion of its range to humid in the east. It is primarily found on moist, nutrient-rich sites; these are some of the most productive sites in the region. It is an early seral condition that typically establishes after fire or harvesting. Two subassociations are distinguished, *typic* and *Populus balsamifera*.

Vegetation: CNVC00241 is a hardwood forest Association with a closed canopy of *Populus tremuloides* and/or *P. balsamifera*. A dense tall shrub layer dominated by *Alnus incana* (see Comments) helps to characterize this association. *Rubus idaeus* is also common in the shrub layer as are regenerating *Abies balsamea* and *Populus tremuloides*. *Acer spicatum* is less common but can be locally abundant. The herb layer is typically dense and usually includes *Rubus pubescens*, *Maianthemum canadense*, *Eurybia macrophylla*, *Cornus canadensis*, *Aralia nudicaulis* and *Clintonia borealis*. Grasses are sometimes abundant and several other herb layer species may be present but have lower constancy and cover. Forest floor cover is predominantly broad-leaf litter, so the moss layer is poorly developed, with only *Pleurozium schreberi* common, mainly on fallen logs and at the base of trees.

P. tremuloides is dominant in the *typic* subassociation whereas *P. balsamifera* is dominant in its subassociation. Compared to the *typic*, the *Populus balsamifera* subassociation has slightly lower constancy and abundance of *A. incana* but greater constancy and abundance of *A. spicatum*. It also has higher constancy of nutrient-demanding herbs such as *Mitella nuda*, *Galium triflorum* and *Petasites frigidus*.

***Populus tremuloides (P. balsamifera) / Alnus incana / Eurybia macrophylla* CNVC00241**

Type Description (cont'd)

Environment: CNVC00241 occurs in a continental boreal climate that becomes increasingly humid farther east and more temperate farther south. It is primarily found on moist, nutrient-rich sites; these are some of the most productive sites in this region of the boreal. Stands are commonly on level sites or gentle slopes, usually on water-receiving, middle to lower or toe-slope topopositions where seepage carries additional water and nutrients through the rooting zone. Soils are moderately deep to deep and usually fine textured clays, fine loams or silts of glaciolacustrine or lacustrine origin. Even in the subhumid climate of the western part of its range, the fine-textured soils retain enough moisture to support *Alnus incana*, a shrub that fixes nitrogen, further enriching the soil nutrient status. Mor humus forms are common, but compared to other boreal Associations, moders and particularly mulls are relatively frequent.

Within the range of CNVC00241, regional fire cycles are intermediate (100-270 years), long (270-500 years) or even very long (>500 years). However, these stands often exist where there are natural fire breaks (e.g., water bodies) and are less prone to fire because of their moisture status. Where the regional fire cycle is intermediate, stands are less likely to burn than the surrounding landscape.

Dynamics: CNVC00241 is an early seral condition that typically establishes after fire or harvesting. *Populus tremuloides* and *P. balsamifera* are pioneer species adapted to disturbance. Following any disturbance that does not kill their roots they can reproduce vegetatively from root suckers. These species also produce abundant, light, wind-dispersed seeds that can readily colonize mineral soil seedbeds exposed by disturbance. Both species grow rapidly in full-light conditions but are intolerant of shade so do not replace themselves in a stand without further disturbance.

Alnus incana can form dense thickets in canopy openings, particularly after harvesting when tree removal can contribute to a rise in the water table. These thickets can significantly delay the growth of regenerating trees. The deep roots of *A. incana* can survive even high-severity fires and it can respond quickly after disturbance by sprouting. Being semi-shade tolerant, *A. incana* persists as the canopy closes, limiting available light for plants beneath it.

Forest tent caterpillar (*Malacosoma disstria*) and *Armillaria* root disease (*Armillaria* spp.) can have significant impacts on *P. tremuloides*. Defoliation by the caterpillar can reduce growth, cause dieback and sometimes lead to mortality. *Armillaria* spp. can weaken or kill individual or small groups of trees. Canopy openings that result from insect or pathogen disturbance can promote forest succession by enhancing the growth of understory trees, such as *A. balsamea* and *Picea* spp.

Range: CNVC00241 occurs in the boreal region of Quebec and Ontario and likely extends into southeastern Manitoba as far west as Lake Winnipeg. In Quebec it is most common on the Clay Belt in the west, but it extends east to the Upper North Shore of the Gulf of Saint Lawrence north of Baie-Comeau and is also known from the Gaspé region and Anticosti Island. CNVC00241 occurs sporadically in the northern temperate region, usually on sites that are cooler than normal for that region (e.g., at higher elevations or on north aspects).

Related Concepts

Similar CNVC Associations:

CNVC00238 [*Populus tremuloides (Betula papyrifera) / Diervilla lonicera*] occurs on drier, poorer sites in the same range and lacks a dense tall shrub layer of *Alnus incana*.

CNVC00239 [*Betula papyrifera (Populus tremuloides) / Acer spicatum / Clintonia borealis*] occurs on sites that are not quite as moist or rich in the same range and has more *Acer spicatum* and less *Alnus incana* in the shrub layer.

CNVC00242 [*Betula papyrifera / Alnus incana*] occurs in Quebec, usually on moist, rich tills, rather than on glaciolacustrine deposits, and *Betula papyrifera* dominates the overstory.

CNVC00272 [*Populus tremuloides – Picea mariana / Alnus incana*] is a similar mixedwood Association that occurs on comparable sites in the same range.

CNVC00333 [*Populus tremuloides – P. balsamifera / Alnus incana – Cornus stolonifera*] occurs in northwestern Ontario and eastern Manitoba on comparable boreal sites. It has more *Alnus viridis*, *Cornus stolonifera*, *Rosa acicularis* and *Viburnum edule* in the shrub layer and more *Eurybia macrophylla* in the herb layer.
